RESEARCH INTERESTS**Summary**

My research integrates field data from geophysical monitoring with rock mechanics and rock physics in order to better understand the deformation processes controlling and leading to rupture processes responsible for earthquakes, volcanic eruptions and geothermal systems and landslides occurrences. I extensively worked on physical and mechanical properties of rocks with relation to studies of seismic tomographies, seismotectonics, field scale strain localisation and transport properties, throughout microseismic monitoring and rock deformation laboratory experiments. In particular my research investigates how physical properties evolve under pressure, temperature and pore fluids, in order to interpret in lithological terms the geophysical investigations and signatures and understand the thermo-hydro-mechanical processes driving seismic ruptures in natural and geostorage systems.
